<i>Preface</i>	vii
1. Identical particles	1
1.1 Some simple considerations	1
1.2 Bosons and fermions	3
1.3 Antisymmetric and symmetric two-particle states	4
1.4 Some experimental consequences related to identical particles	9
1.5 Antisymmetric and symmetric many-particle states	11
1.6 Exercises	15
2. Second quantization	17
2.1 Fermion addition and removal operators	17
2.2 Boson addition and removal operators	20
2.3 One-body operators in Fock space	21
2.4 Two-body operators in Fock space	24
2.5 Examples	27
2.6 Exercises	28
3. Independent-particle model for fermions in finite systems	31
3.1 General results and the independent-particle model	31
3.2 Electrons in atoms	34
3.3 Nucleons in nuclei	38
3.3.1 Empirical Mass Formula and Nuclear Matter	44
3.4 Second quantization and isospin	46
3.5 Exercises	50

4.	Noninteracting Fermi gas	51
4.1	The Fermi gas at zero temperature	51
4.2	Electron gas	54
4.3	Nuclear matter	55
4.4	Neutron matter	55
4.5	Liquid ^3He	55
4.6	Exercises	56
5.	Two-particle states and interactions	57
5.1	Symmetry considerations for two-particle states	57
5.2	Two particles outside closed shells	59
5.3	General discussion of two-body interactions	61
5.4	Examples of relevant two-body interactions	64
5.5	Exercises	68
6.	Bosons and fermions at finite temperature	69
6.1	Some statistical mechanics	69
6.2	Bosons at finite T	71
6.2.1	Bose-Einstein condensation in infinite systems	71
6.2.2	Bose-Einstein condensation in traps	74
6.2.3	Trapped bosons at finite temperature: thermodynamic limit	77
6.3	Fermions at finite T	79
6.3.1	Noninteracting fermion systems	79
6.3.2	Fermion atoms in traps	80
6.4	Exercises	83
7.	Propagators in one-particle quantum mechanics	85
7.1	Time evolution and propagators	85
7.2	Expansion of the propagator and diagram rules	88
7.2.1	Diagram Rules for the Single-Particle Propagator	89
7.3	Solution in the case of discrete states	92
7.4	Scattering theory using propagators	95
7.4.1	Partial Waves and Phase Shifts	98
7.5	Exercises	102
8.	Single-particle propagator in many-particle systems	103
8.1	Fermion single-particle propagator	104

Contents

xi

8.2	Lehmann representation	105
8.3	Spectral functions	106
8.4	Expectation values of operators in the correlated ground state	108
8.5	Propagator for noninteracting systems	110
8.6	Direct knock-out reactions	113
8.7	Comparison with $(e, 2e)$ data for atoms	116
8.8	Comparison with $(e, e'p)$ data for nuclei	116
8.9	Exercises	116
9.	Perturbation expansion of the single-particle propagator	117
9.1	Time evolution in the interaction picture	117
9.2	Expansion in terms of noninteracting propagators	118
9.3	Wick's theorem	120
9.4	Diagrams	130
9.5	Diagram rules	135
9.5.1	Time-dependent version	135
9.5.2	Energy formulation	144
9.6	Exercises	149
10.	Dyson Equation	151
10.1	Analysis of perturbation expansion, self-energy, and Dyson's equation	153
10.2	Equation of motion method for propagators	159
10.3	Two-particle propagator, vertex function, and self-energy .	161
10.4	Dyson equation and the vertex function	166
10.5	Exercises	169
11.	Mean-field approximation at $T = 0$	171
11.1	Derivation of the Hartree-Fock equations	171
11.2	Variational content of the HF equations	174
11.3	Hartree-Fock in infinite systems	175
11.3.1	General considerations	175
11.3.2	The electron gas	177
11.3.3	Nuclear matter	177
11.4	Hartree-Fock method in atoms	177
11.5	Comparison with experimental data	177
11.6	Hartree-Fock for molecules	177
11.7	Exercises	177

xii	<i>Book Title</i>	
12.	Interacting boson systems at $T = 0$	179
12.1	Introduction	179
12.2	Boson propagators	180
12.2.1	Single-particle propagator	180
12.2.2	Equation of motion	180
12.2.3	Non-interacting propagators	181
12.3	Hartree-Bose approximation through variational ansatz	182
12.4	Standard perturbation expansion for bosons	183
12.4.1	Bogoliubov method	183
12.4.2	Number conserving approach	183
12.5	Gross-Pitaevski equation for dilute systems	184
12.6	Computer exercise	184
13.	Beyond the mean-field approximation	185
13.1	Second-order self-energy	185
13.2	Schematic model	185
13.3	Application to nuclei	185
13.4	Application to atoms	185
13.5	Exercises	185
14.	Excited states	187
14.1	Polarization propagator	188
14.2	Random Phase Approximation	192
14.3	Schematic model in finite systems	196
14.4	Lindhard function	196
14.5	Plasmons in the electron gas	196
14.6	Excitations of a normal Fermi liquid	196
14.7	Exercises	196
15.	Excited states in $A \pm 2$ systems	197
15.1	Two-particle problem	197
15.2	Ladder diagrams and short-range correlations	197
15.3	Pair excitations in nuclear matter	197
15.4	Cooper problem and pairing instability	197
15.5	Particle-particle hole-hole RPA in finite systems	197
15.6	Exercises	197
16.	Dynamical treatment of the self-energy	199

Contents

xiii

16.1 Spectral function of the electron gas	199
16.2 Spectral function of nuclear matter	199
16.3 Long-range correlations in finite systems	199
16.4 Baym-Kadanoff procedure for excited states	199
16.5 Computer problems	199
17. Pairing phenomena	201
17.1 Anomalous propagators	201
17.2 BCS gap equation	201
17.3 Applications	201
17.3.1 Superconductivity in metals	201
17.3.2 Superfluid ^3He	201
17.3.3 Superfluidity in neutron stars	201
17.4 Computer problems	201
18. Perturbation theory at finite temperature	203
18.1 Matsubara formalism	203
18.2 Diagram rules at finite T	203
18.3 Hartree-Fock at finite T	203
18.4 BCS at finite T	203
18.5 Spectral functions at finite T	203
18.6 Exercises	203
Appendix A Pictures and Gell-Mann and Low Theorem	205
A.1 Schrödinger Picture	205
A.2 Interaction Picture	206
A.3 Heisenberg Picture	210
A.4 The adiabatic switching one of the full interaction	212
A.5 Gell-Mann and Low Theorem	214
<i>Bibliography</i>	221
<i>Index</i>	225
